

# VOCES. AN R-BASED DASHBOARD FOR LEXICAL SEMANTICS

Krzysztof Nowak (krzysztof.nowak@ijp.pan.pl)  
Institute of Polish Language (Polish Academy of Sciences)

## MOTIVATION

- quick inspection of word properties in lexicographic and lexicologist practice
- rapid integration of the code produced by a research group and external R packages (wordspace etc.)
- reducing distance between development and users
- filling the space between fully-fledged corpus query systems and ad-hoc scripting

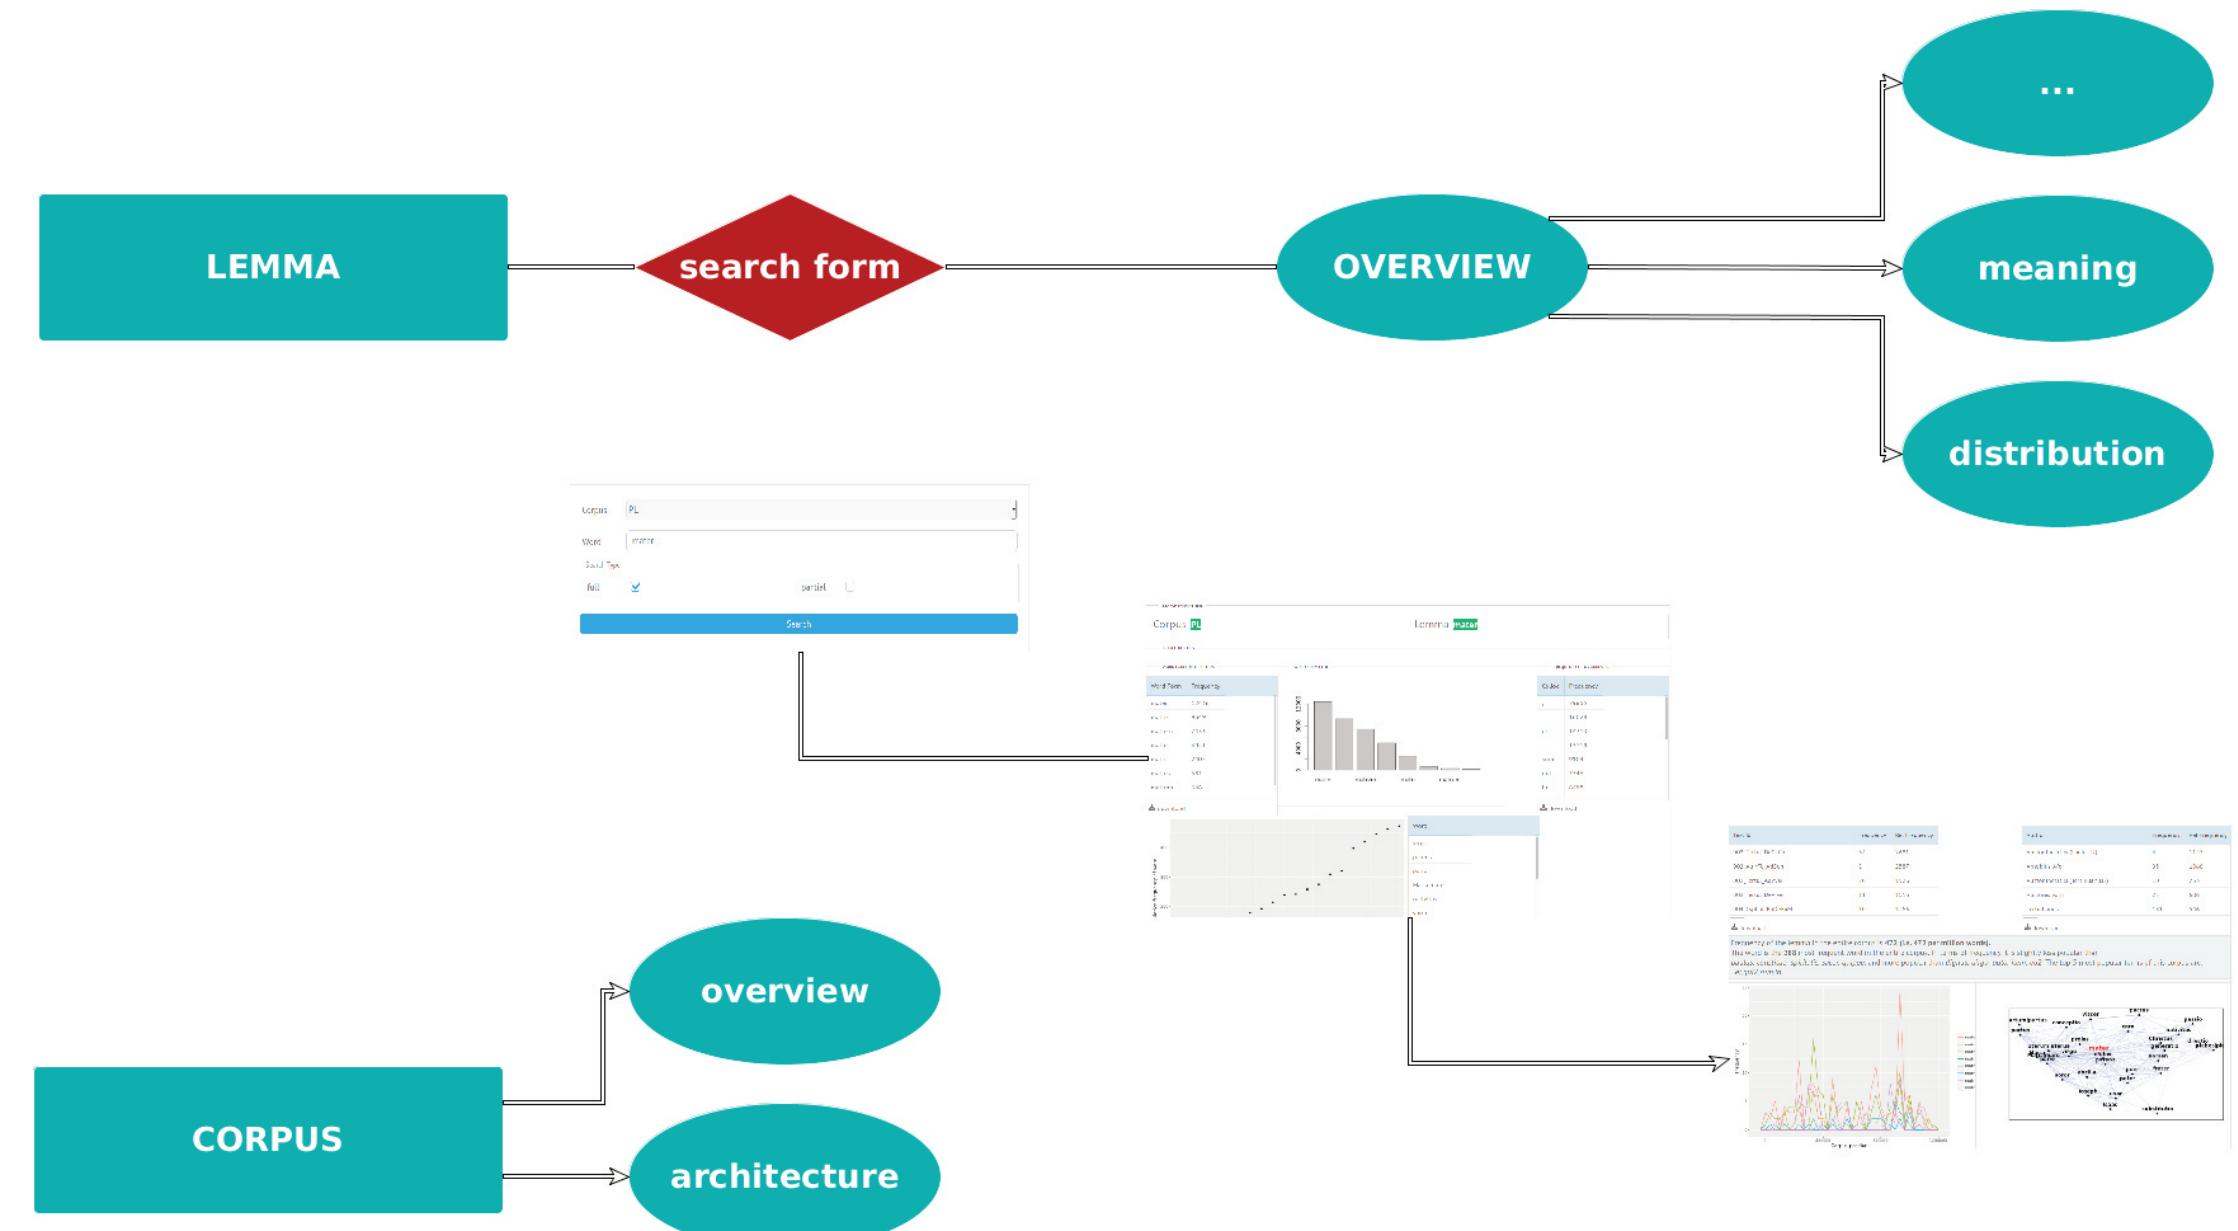

## POINTS OF ACCESS

### single lemma

- query starts with the simple search form
- on success the Overview page is populated with widgets presenting selected lemma properties
- on widget click the Details page opens

### corpus

- basic corpus stats may be inspected from the Corpus Info page

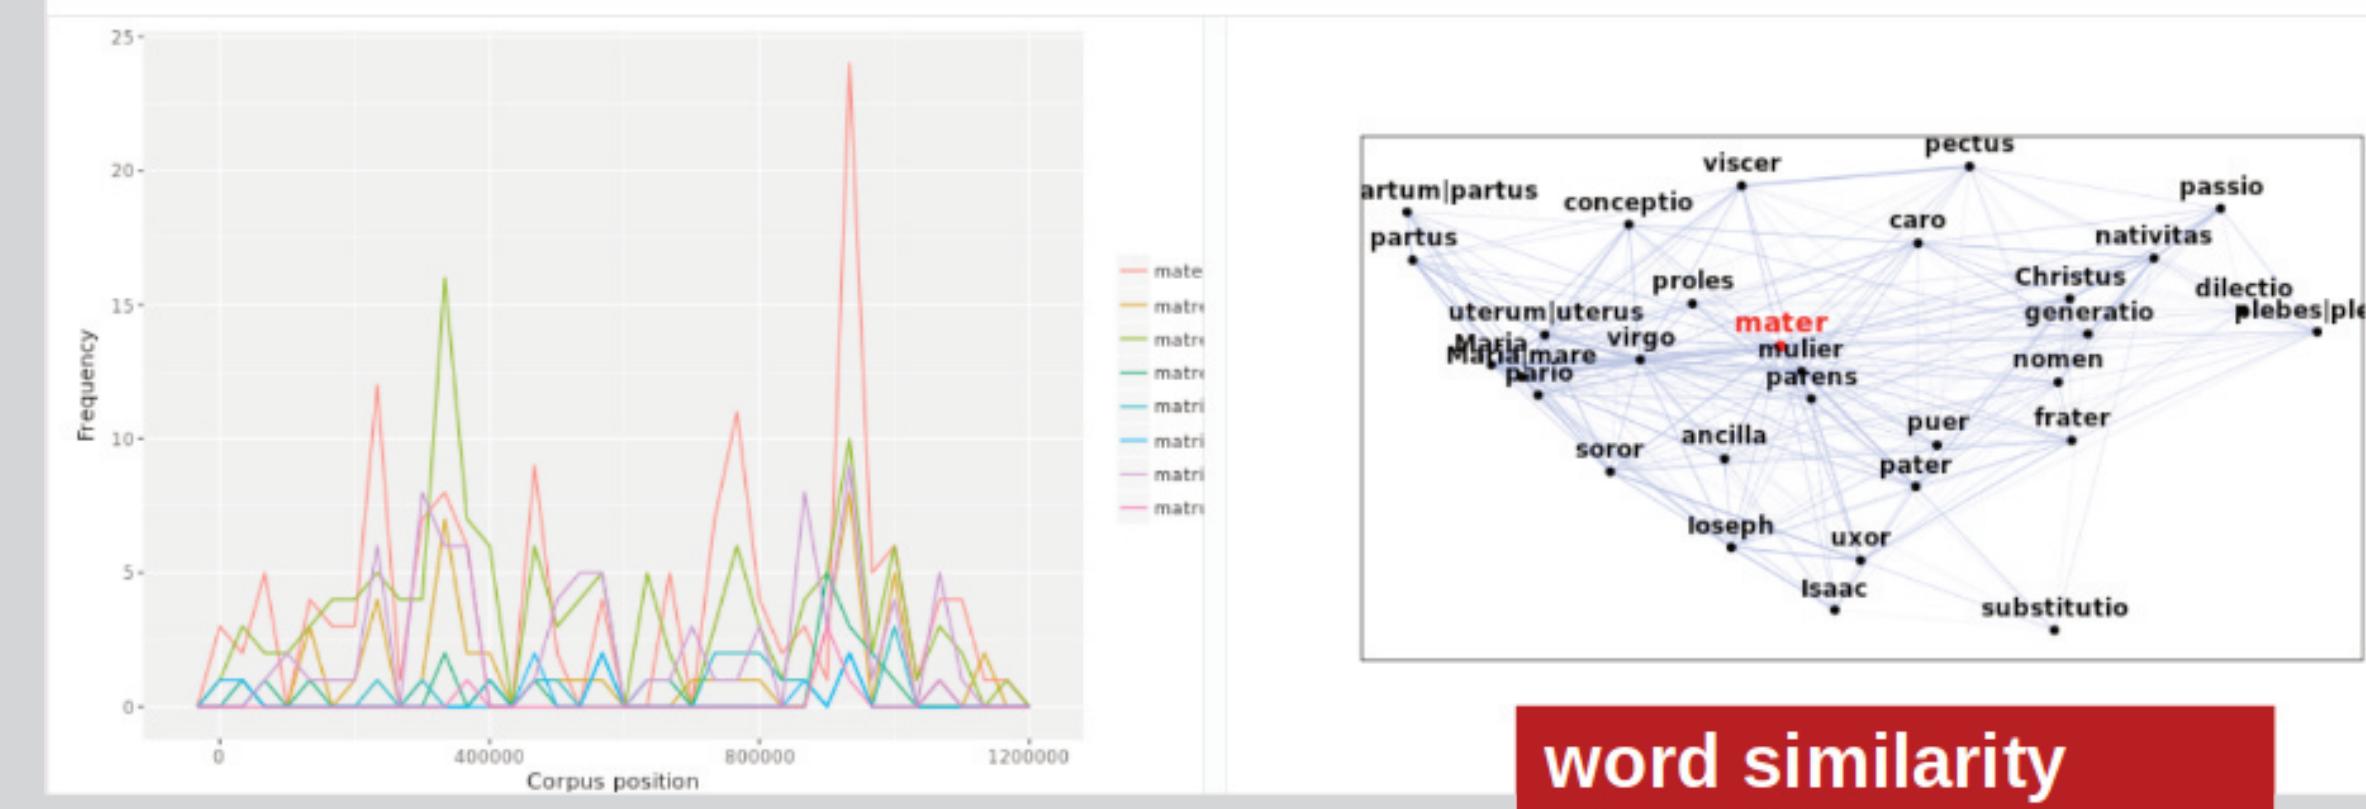

## THE DETAILS PAGE

### word distribution by authors and texts

Text Id	Frequency	Rel.	Author	Frequency	Rel.
002_Tertul_DeCaCh	34	2681	Auctor incertus (Lucius I?)	4	1153
002_Autinfe_AdSen	2	2587	Amobius Afer	93	1066
002_Tertul_AdVal	20	1926	Auctor incertus (Tertullianus?)	10	753
002_Tertul_DevVe	11	1513	Auctores varii	23	606
004_CypCar_EpDeExM	10	1266	Tertullianus	181	546

### basic prose description of the word distribution

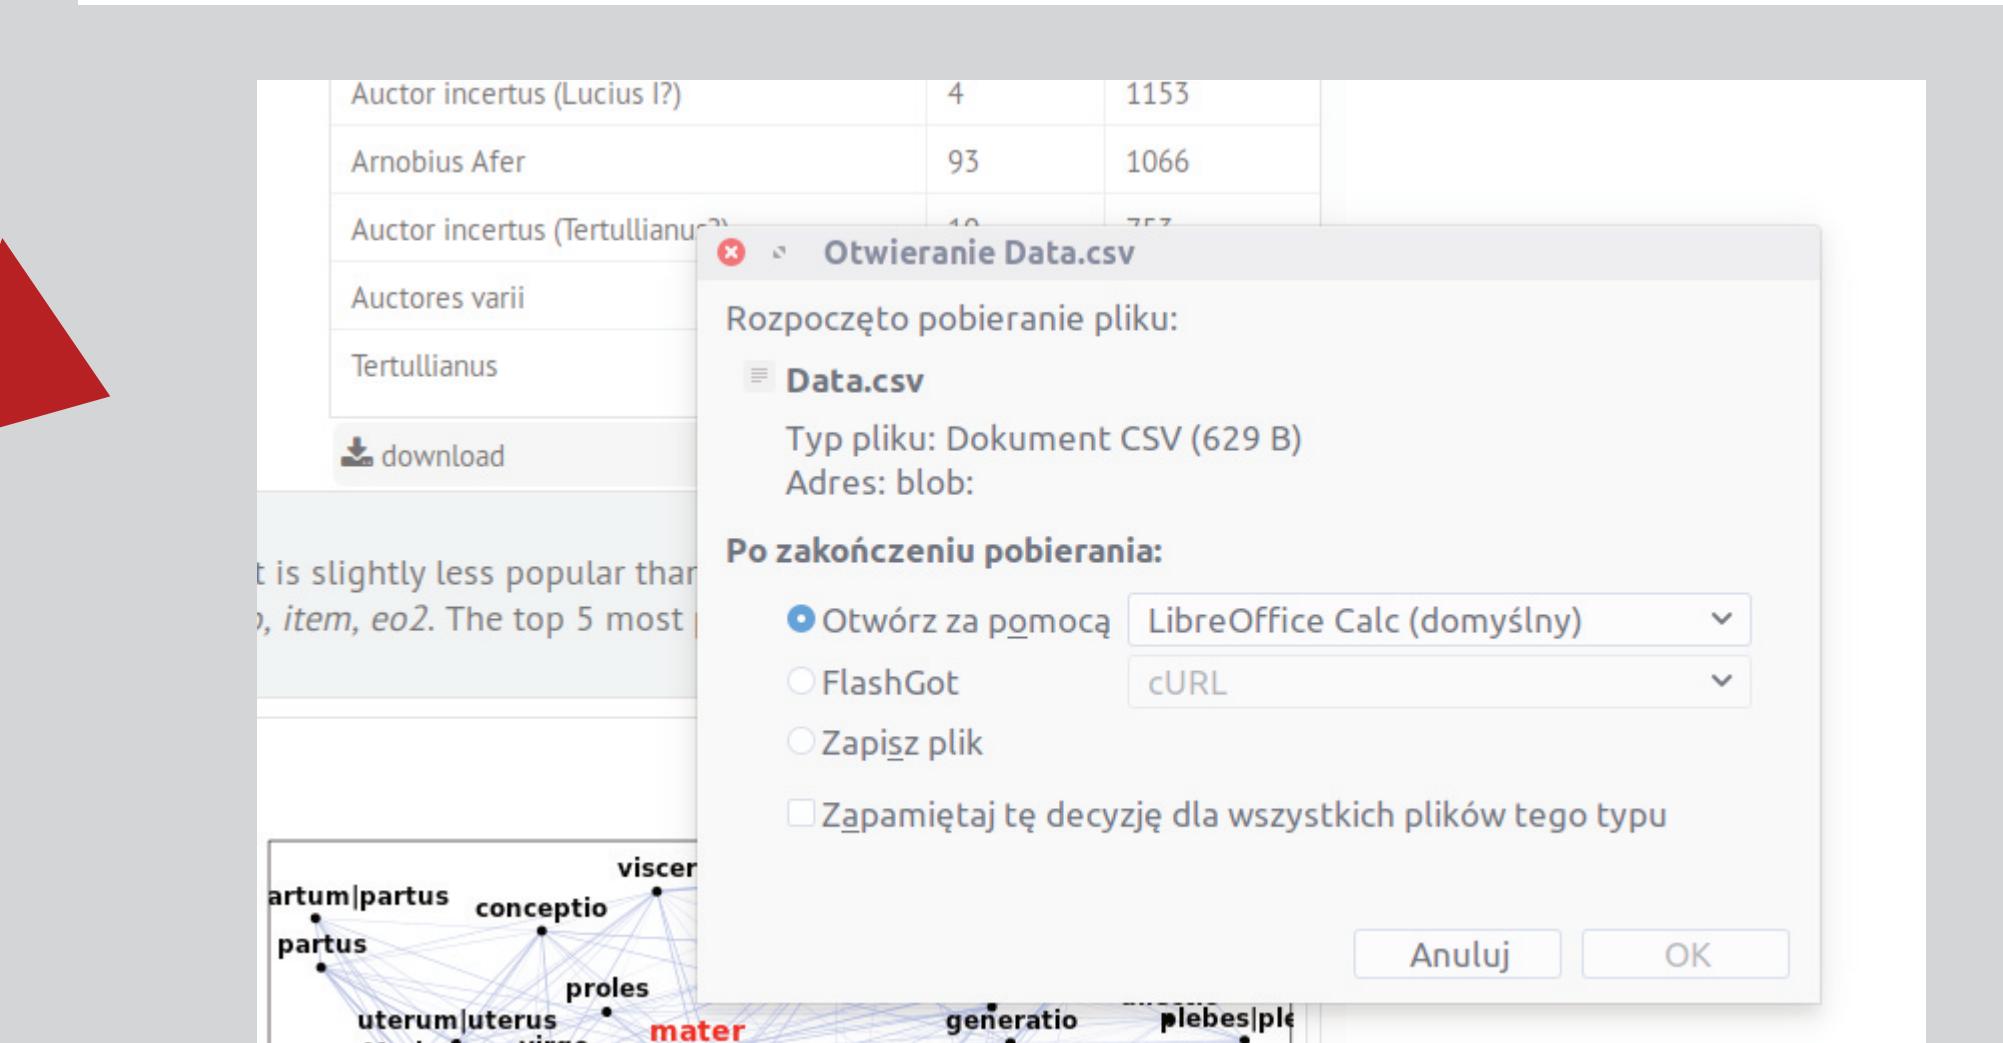

### wordform frequency by corpus position

Author	Frequency	Rel Frequency
Auctor incertus (Lucius I?)	4	1153
Amobius Afer	93	1066
Auctor incertus (Tertullianus?)	10	753
Auctores varii	23	606
Tertullianus	181	546

## UNDERSTAND

text snippets explain where the data come from and how they have been computed

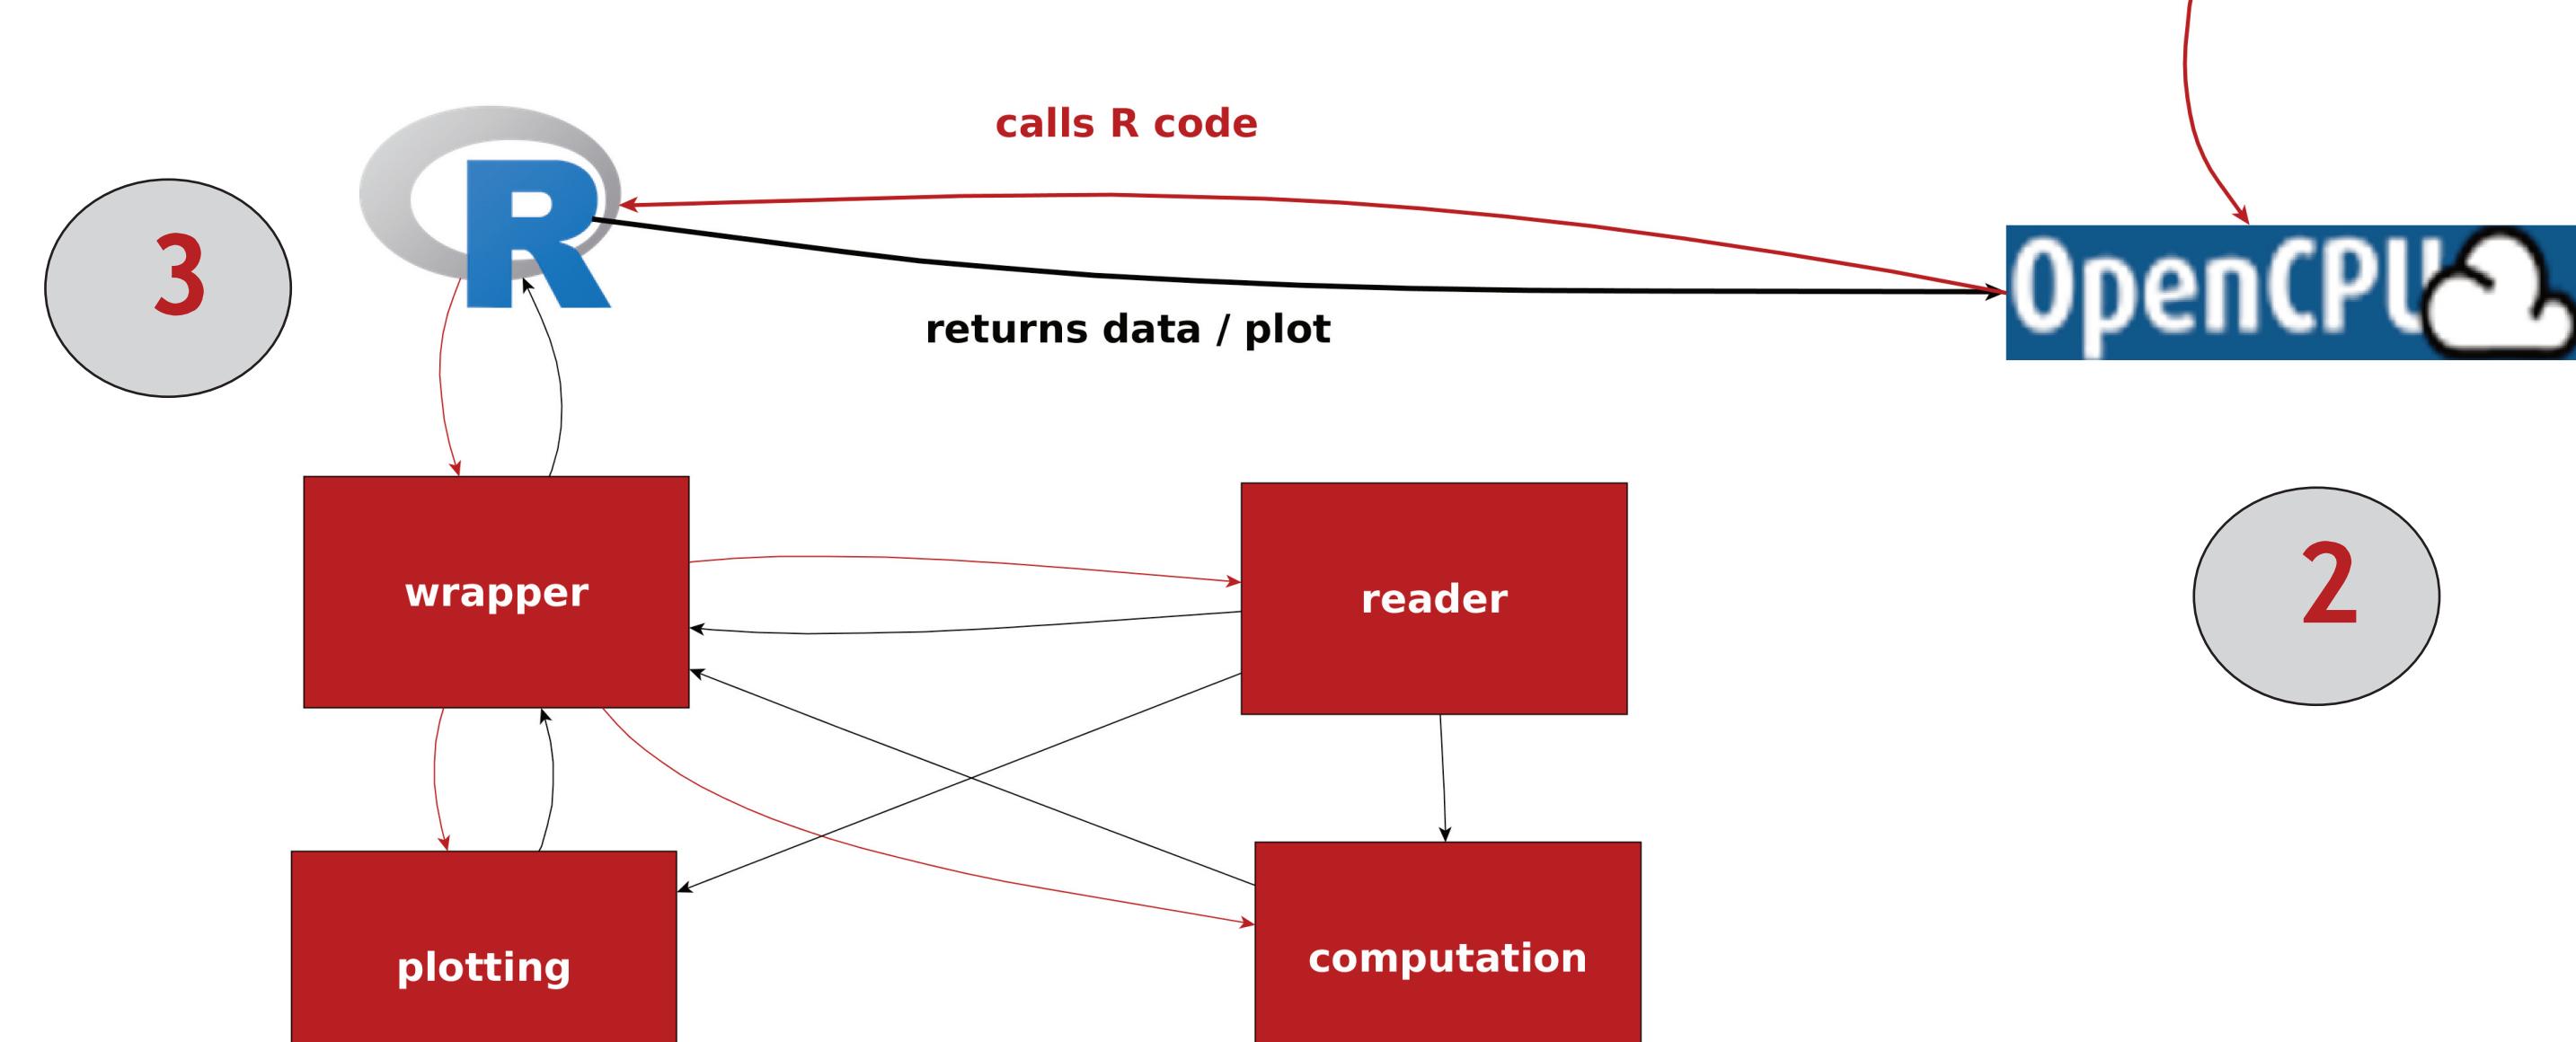

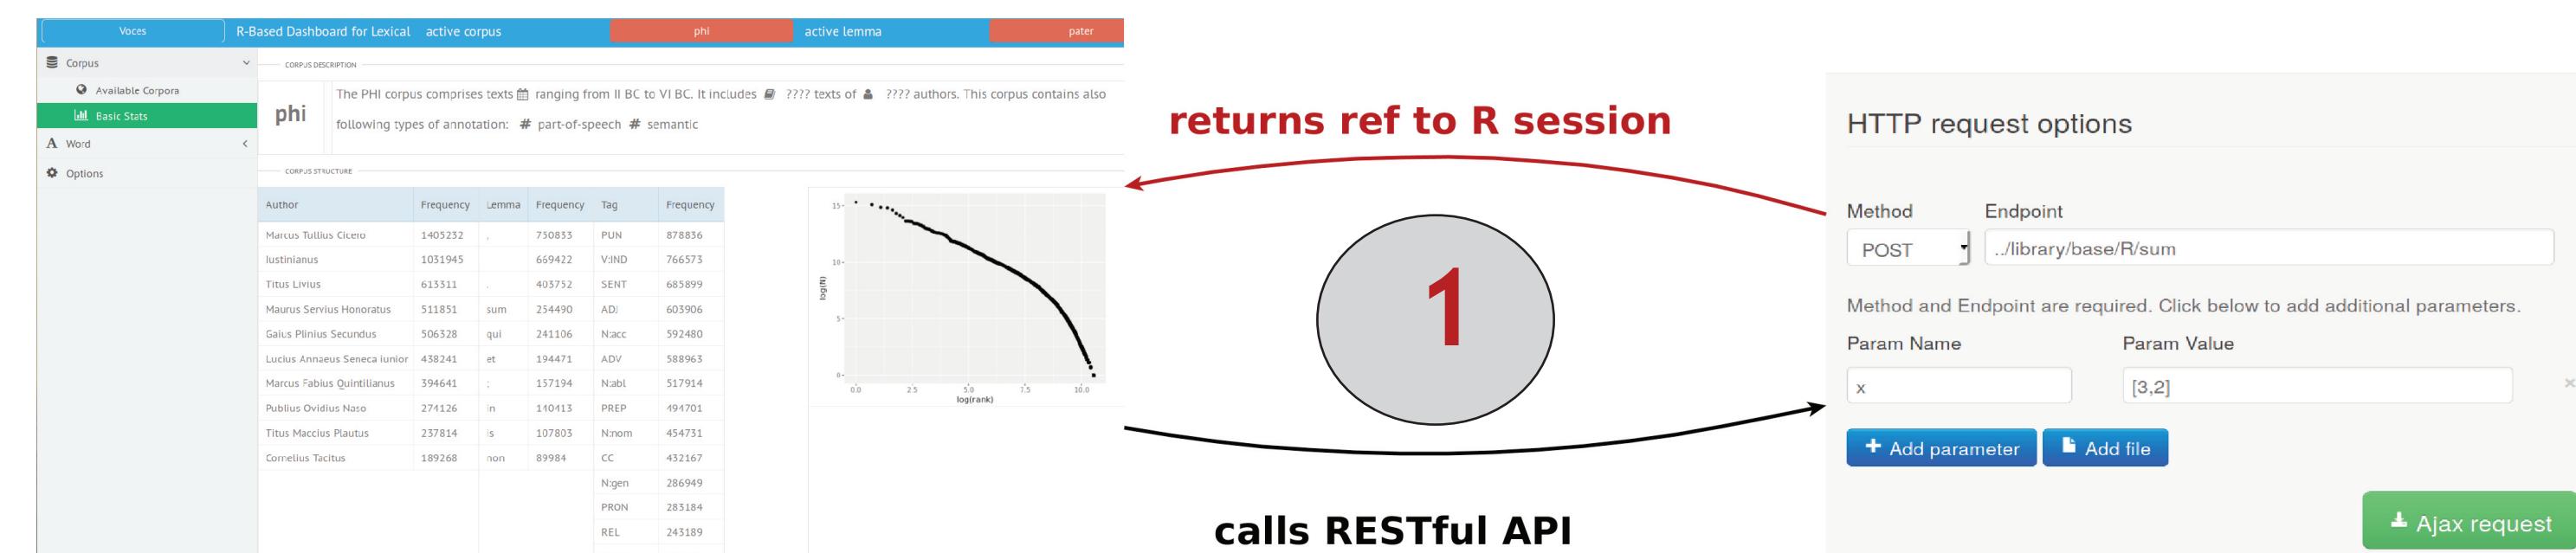

## REUSE

both raw data and graphics can be downloaded

## 3. R SERVER

- the entire code is stored in a single package
- on session start data tables (word / lemma frequency etc.) are loaded into memory
- wrapper functions: process user's input, dispatch call to relevant functions, return results
- reader functions: communicate with NoSketchEngine, CWB etc. and process their output
- plotting and computation functions

## HOW DOES IT WORK?

## I. INTERFACE

- written in Webix (a JS UI library)
- communicates with a REST API
- processes output of the R session
- displays returned data as tables, d3.js charts etc.
- embeds R plots

## 2. OPENCPU

- communicates with the R server
- exposes an R session as REST API to the web application
